

LTE Positioning

Every new smartphone and many other devices such as cameras contain GPS receivers to determine the location of the user. But in cities and indoors GPS reception can be impossible.

Therefore, we are interested in using other signals such as the LTE mobile signals for localization. These signals of opportunity are interesting for localization because they can be used without any infrastructure cost and provide higher received power than GPS.

The goal of this project is to implement a localization system using LTE signals and evaluate its performance. Also, other signals can be considered to be used.

We have some ideas on how to approach this task, but we would love to hear your take on this as well! If this sounds interesting to you, do not hesitate to contact us so we can have a chat.

Requirements: Programming experience is an advantage. There will be weekly meetings with your supervisors to discuss progress and open questions.

Interested? Please contact us for more details!
