| $\mathbf{c}^{\prime}>\mathbf{c}$ | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |

Voters preferring c to c' form a "circular" interval!
$\Leftrightarrow$ At most 2 switches per row.
k-Crossing Elections

## k-Crossing Elections

An election is $k$-crossing if voters can be reordered such that preference between any two candidates $\mathrm{c}, \mathrm{c}$ ' changes at most k times as we sweep through the voters in order:

## k-Crossing Elections

An election is $k$-crossing if voters can be reordered such that preference between any two candidates $c, c^{\prime}$ changes at most $k$ times as we sweep through the voters in order:

$$
\begin{aligned}
& \mathrm{v}_{1}: \mathrm{c}_{1}>\mathrm{c}_{2}>\mathrm{c}_{3} \\
& \mathrm{v}_{2}: \mathrm{c}_{3}>\mathrm{c}_{2}>\mathrm{c}_{1} \\
& \mathrm{v}_{3}: \mathrm{c}_{2}>\mathrm{c}_{3}>\mathrm{c}_{1} \\

## Recognition for Two-Crossing

Given candidates $\mathrm{c}_{1}, \ldots, \mathrm{c}_{\mathrm{M}}$ and voters $\mathrm{v}_{1}, \ldots, \mathrm{v}_{\mathrm{N}}$, build matrix with rows indexed by pairs ( $c_{i}, c_{\mathrm{i}}$ ) with $i<j$ and columns indexed by voters $v_{k}$. Put a 1 at row ( $c_{i}, c_{j}$ ), column $v_{k}$, iff $v_{k}$ prefers $c_{i}$ to $c_{j}$.
Then, check whether columns can be permuted s.t. 1s in each row form a continuous circular run.
[Booth and Lueker, 1976]

$$
\begin{aligned}
& v_{1}: c_{1}>c_{2}>c_{3} \\
& v_{2}: c_{3}>c_{2}>c_{1} \\
& v_{3}: c_{2}>c_{3}>c_{1} \\
& v_{4}: c_{3}>c_{1}>c_{2}
\end{aligned}
$$

O(NM ${ }^{2}$ )

## Consequences: NP-hardness

Thus, NP-hardness results carry over to two-crossing:
(0) Kemeny and Slater are NP-hard.

## Consequences: NP-hardness

Thus, NP-hardness results carry over to two-crossing:
(0) Kemeny and Slater are NP-hard.
(0) Banks, Minimal Extending Set, Tournament Equilibrium Set and Ranked Pairs also NP-hard.

## 4. <br> Young's Rule

Using Total Unimodularity

Young's Rule

## Young's Rule

The Young score of candidate $c$ is the least number of voters that need to be removed to make ca Condorcet winner.

## Young's Rule

The Young score of candidate $c$ is the least number of voters that need to be removed to make ca Condorcet winner. Winners are candidates with the least score.

## Young's Rule

The Young score of candidate $c$ is the least number of voters that need to be removed to make ca Condorcet winner. Winners are candidates with the least score.
( ) NP-hard in general:
[Rothe et al., 2003; Brandt et al., 2015;
Fitzsimmons and Hemaspaandra, 2020].

## Young's Rule

The Young score of candidate $c$ is the least number of voters that need to be removed to make ca Condorcet winner. Winners are candidates with the least score.
(0) NP-hard in general:
[Rothe et al., 2003; Brandt et al., 2015;
Fitzsimmons and Hemaspaandra, 2020].
(0) Two-crossing: scores in poly-time (this paper).

Young's Rule

## Young's Rule

The natural LP does not have integer vertices.

## Young's Rule

The natural LP does not have integer vertices.

By fixing the number of voters to keep we arrive at an LP with integer vertices, so we can solve the LP.

## Young's Rule

The natural LP does not have integer vertices.

By fixing the number of voters to keep we arrive at an LP with integer vertices, so we can solve the LP.

By reducing to negative weight cycle detection we further improve the running time to $0\left(\left(n+m^{2}\right) n^{3 / 2} \log n\right)$.

Egalitarian-CC is NP-hard.
[Betzler et al., 2013]
Egalitarian-CC is NP-hard for three-crossing. [Misra et al., 2017]
Both polynomial for single-crossing.
[Skowron et al., 2015], [Constantinescu and Elkind, 2021]
Both polynomial for two-crossing (this paper).

## Preliminaries

## Preliminaries

Say voters $\mathrm{v}_{1}, \ldots, \mathrm{v}_{\mathrm{N}}$ are in a two-crossing order.

## Preliminaries

Say voters $\mathrm{v}_{1}, \ldots, \mathrm{v}_{\mathrm{N}}$ are in a two-crossing order.

Let $r:\left\{v_{1}, \ldots, v_{N}\right\} \rightarrow\left\{c_{1}, \ldots, c_{M}\right\}$ be the function mapping voters to representatives in an optimal CC committee.

## Preliminaries

Say voters $\mathrm{v}_{1}, \ldots, \mathrm{v}_{\mathrm{N}}$ are in a two-crossing order.

Let $\mathrm{r}:\left\{\mathrm{v}_{1}, \ldots, \mathrm{v}_{\mathrm{N}}\right\} \rightarrow\left\{\mathrm{c}_{1}, \ldots, \mathrm{c}_{\mathrm{M}}\right\}$ be the function mapping voters to representatives in an optimal CC committee.

There exists a decomposable optimal committee!

## Future Directions

## Future Directions

1. Try two-crossing on PrefLib.

## Future Directions

1. Try two-crossing on PrefLib.
2. Hardness of recognizing k-crossigness.

## Future Directions

1. Try two-crossing on PrefLib.
2. Hardness of recognizing k-crossigness.
3. Hardness of Dodgson's rule for two-crossing.

## Future Directions

1. Try two-crossing on PrefLib.
2. Hardness of recognizing k-crossigness.
3. Hardness of Dodgson's rule for two-crossing.
4. Hardness of Young's rule for three-crossing.

## Future Directions

1. Try two-crossing on PrefLib.
2. Hardness of recognizing k-crossigness.
3. Hardness of Dodgson's rule for two-crossing.
4. Hardness of Young's rule for three-crossing.

Three-crossing and above in general?
