

## Android Backup

Data loss is a big problem in today's digital society. Especially losing the data from your phone can be annoying. Often you don't have a backup or not a recent one. When you lose your phone or it breaks, you often lose your contacts, photos etc. Creating backups manually takes quite a lot of time. Many services exist to synchronize photos or contacts to the cloud but they often work only for one specific kind of data. Additionally, you are often restricted to this one service and have to trust it.

The goal is to create a system that makes it easy for the user to backup all his/her data and also access it. We have some ideas on how to approach this task, but we would love to hear your take on this as well! If this sounds interesting to you, do not hesitate to contact us so we can have a chat.

**Requirements:** Creativity and programming skills are an advantage. There will be weekly meetings with your supervisors to discuss progress and open questions.

**Interested? Please contact us for more details!**
