

**Lab/BA/SA/Group:**

Wearable Computers

Motivation and Informal Description

Wearable computers are on the rise. Most of the major players have already released or are rumored to release some kind of wearable computer very soon. But right now they have a similar problem as tablets and smartphones had in the very beginning. Nobody really knows what they are good for. With smartphones people slowly started to see their huge advantage these devices could have. And nowadays, there are a myriad of different apps for our phones, which help us in our everyday life.

Now the time has come to create apps, which in the future appear obvious and will be used by millions of people, but don't exist yet. We already have some ideas for new apps for smartwatches exploiting the features they have. But we also look forward to hearing your ideas.

Requirements

Good programming skills. The student(s) should be able to work independently on this topic!
